GREAT PREPARATION

There is no substitution for Great Preparation. Whether you are a kid in school, a surgeon or one of us putting down concrete coatings, success starts with great Preparation. We recommend mechanically grinding the concrete floor with an industrial grade diamond grinder to create the best surface for the coatings adhesion. This is simply the best way to do it. No acid wash, no skipping this step. Do the prep right and you will have no worries.

GREAT COATINGS

They make world class glues out of epoxy. The reason is, they are sticky. Epoxies simply adhere to substrates like concrete better than anything else. This epoxy boasts a 100% solids 9 lb. Water Vapor Barrier Epoxy as the prime coat. Next, you'll lay down a coat of Vinyl Paint Chip Media to give the coating it's granite like look, make it thick and give it great insulating qualities. Lastly, you'll add a Polyaspartic Top Coat. Polyaspartics are many time harder than epoxies, have better chemical resistance and have much better UV stability. This is a great modern coating that you can trust to last!

PLEASURE TO BE ON

Because of the thick insulating nature of these coatings your garage will be warmer in the winter and cooler in the summer. It turns a cold, dusty space into an interior room that you will want to be in and enjoy.

SAFETY

Easy to Clean, BPA Free, Slip Resistant and VOC Compliant
